Nadine's Message

Dear friends:

Albeit late, I want to wish all of you a very happy New Year and for only wonderful things to happen for you and your family.

Thanks to each and every one of you; wonderful things happened for Springboard in 2012. Your commitment to mainstreaming disability in the global workforce, workplace and marketplace has allowed us to double in size, providing you with more services and support in more countries than ever before.

Why is this important? Because as you know all too well, the legislative landscape in support of individuals with disabilities is ever changing and it's quite varied from country to country; a huge challenge for so many of you who have global responsibilities.

We look forward to continuing our collaboration with you and your teams on this most important 2013 journey.

Nadine

Oversight Can Lead to Costly Legal Problems

Employers commonly provide staff training on their workplace policies and procedures especially those concerning anti-harassment. Training on workplace policies about equal employment opportunities for applicants and workers with disabilities is less common and often not effective. No doubt, every employee needs a general overview of the laws governing office operations. Training supervisors and managers, about reasonable accommodation issues, is equally important as an integral part of your company's training program. Reviewing and modifying when necessary, company policies and procedures aimed at removing workplace barriers is equally important in order to comply with disability anti-discrimination laws, such as the Americans with Disabilities Act (ADA). Furthermore, awareness, understanding and consistent follow-through of these policies and procedures by all personnel can determine a company's potential risk for disability discrimination complaints.

Employees may go to human resources or those responsible for processing requests, such as their supervisor or manager, when an "accommodation" is requested. If these personnel don't know how to recognize and respond to reasonable accommodation requests, they could be denying such requests without even realizing they are putting the company at risk for discrimination allegations based on disability. This could result in increased liability for the employer under the ADA.

Consider the following situation, discussed with an employer on Springboard's ADA Hotline:

Several times a day for the past month, our receptionist has missed numerous phone calls and has not been at her desk to greet clients. The supervisor overheard the receptionist tell a co-worker that she feels tired much of the time, is always thirsty, and constantly has to go to the bathroom. The supervisor suspects that the employee may have a disability, such as diabetes. What should the supervisor do?

How the supervisor responds in this situation may help you reduce your liability exposure under the ADA and state disability laws. Does your training program provide practical information that provides proper ways for supervisors to handle the following concerns?

- May the supervisor ask the receptionist whether she has diabetes? Are there any instances when an employer may ask an employee about diabetes or other disabilities?
- May the supervisor ask the secretary why her performance has declined?

The ADA Inquirer - continued

Shelley A. Kaplan, Manager, ADA Services, Springboard Consulting, LLC

- May the supervisor send her for a medical exam because s/he has reason to believe that diabetes may be affecting the receptionist's ability to perform one of her essential duties (sitting at the front desk for long periods of time)?
- Can the supervisor require the employee to provide a doctor's note or other explanation to justify her change in performance on the job?

Accordingly, it's very important to train all supervisors and managers on ADA accommodations, including:

- How to recognize and respond to an "accommodation" request, including any request by an applicant or employee for a change in policy or procedure or other assistance related to his or her employment due to a medical condition. Such requests may be communicated in plain English and unintentionally overlooked as a request for an accommodation.
- What can and cannot be said to an applicant or employee requesting an accommodation, including not telling the employee the accommodation can't be provided before engaging in the "interactive process" to fully evaluate the accommodation request.
- How to ensure the confidentiality of all medical and other information received from an employee related to an accommodation request.
- What to do to ensure an employee who is provided an accommodation is not mistreated by coworkers due to the accommodation.

Supervisors and managers in your company may be violating employee rights under the ADA and not even know it. These oversights can lead to costly legal problems...problems that can be avoided or minimized with the proper training.

Helping your supervisors and managers understand how the Americans with Disabilities Act and other disability laws work may keep you out of court trying to explain why you didn't provide reasonable accommodation for a valued, hard-working employee with a disability who needed some help.

If you're interested in learning more, Springboard offers a variety of resources that address the above situation, such as onsite customized training and Audio Learning Experiences. Contact us to discuss what works best for you.

Peter McNally, IT/Web Accessibility Consultant, Springboard Consulting, LLC

Mobile Accessibility Summary

Mobile devices are next big thing in technology. Most organizations if they haven't already are moving to ensure they have their mobile experiences covered either on smartphones, tablets or both. Many people in the disability community, such as the blind and visually impaired have become big fans of mobile technology like the iPhone [1]. Therefore, from now on it is not good enough to just consider Web browser accessibility; we must now think about what does accessibility mean when we talk about mobile.

What are the unique issues for mobile?

The obvious main difference with Mobile experience is the screen size and input. Web pages that were designed to fit on a PC may be very hard to view and use on a smartphone or tablet. Furthermore, using fingers to tap and scroll presents different interactions and challenges than using a mouse. Now add in the challenges that a user with a disability has and you can see the potential issues that may arise.

Are there different standards that apply to mobile?

In surveying the latest trends in mobile accessibility I was surprised, that unlike for web pages, there is no clear set of mobile accessibility standards. This may be because the mobile technology field is relatively young compared to the Internet. Furthermore, there is a split into different technology camps such as IOS for iPhone/iPad and Android that use different operating systems and therefore have different techniques to developing for accessibility. With web accessibility standards we are mostly focused on one technology, i.e., HTML.

It seems the consensus out there is to follow current Web standards such as WCAG 2.0 and other Web-based standards as a baseline. According to Jonathan Avila [6] from SSB BART group, the same accessibility standards apply to mobile; such as WCAG 2.0 and Section 508 (in the US). In addition, Jonathan points to the recent US legislation, CVAA (Twenty first century Communication and Video Accessibility Act). The CVAA mandates that mobile web browsers are accessible to the Blind. Furthermore, the CVAA calls for media players to support captioning for video and audio descriptions.

The following are some guidelines or best practices for mobile (both mobile web sites and apps). This is a high-level overview. The references give more details and provide platform specific instructions for using some accessibility features. Also, the references provide some best practice for usability. I did not include these since you should be doing this anyway!

Technical Wire - continued

Peter McNally, IT/Web Accessibility Consultant, Springboard Consulting, LLC

General

- **Give feedback to the user**

When the user makes an entry, this should be confirmed both with a sound and with a short vibration if the device supports this. However, it should also be possible to switch off the feedback. Please note that input need not necessarily be text via a keyboard. It may be a voice command, a photo that has been taken, a gesture or a movement with the mobile. Feedback should be given in most cases but there may be exceptions as too much feedback would be a nuisance (for example, an application that functions as a pedometer must not give feedback for every step registered). [2]

- **In forms use the correct virtual keyboard to match the user's input [2, 3, 4]**

- **Line lengths must be adapted to the screen width but never exceed 70 characters per row, including spaces.**

Where possible, it should not be necessary to scroll sideways to read a row of content. At the same time, the line length must not be so short that individual words must be divided over several lines unless there is a natural break. The objective should be line lengths of 55-60 characters, including spaces, per line. [2]

Zoom

- **Ensure Zoom can be enabled and all text readable. [3]**

Touch

- **Ensure all content and functionality is available by touch [4]**

- **Ensure all buttons/icons are big enough and far enough apart for good "tapability".**

Recommendations vary by device and manufacturer, but it seems a good rule of thumb is 10mm x 10mm with 2mm between buttons/icons. [5]

- **Make it possible to control the interface with just one finger**

There may be situations in which it is not possible. However, where feasible, it must be possible to control all functionality with just one finger. It may be necessary for buttons to be hidden and to appear when you touch a certain area on the screen or press another button. [2]

- **Do not insert functions that can only be managed via gestures. Always add a (redundant) button/link [2]**

Technical Wire - Continued

Peter McNally, IT/Web Accessibility Consultant, Springboard Consulting, LLC

Voice Output

- **Label graphic elements, icons and buttons with their reason or function**
On websites, significant images must have a text alternative. In the same way, images and buttons in applications must have a description. Exactly how this is done varies between the different operating systems. [2, 7]
- **Each form object must have either a caption or a description**
Form objects, for example text fields, radio buttons and check boxes, must, where feasible, have a visible caption that is linked to the form field in a correct manner. [2]
- **Just like with alt text for images on web page, all images should be labeled appropriately to support voice output** [3]
- **All decorative objects should be ignored** [8]

Conclusion

As can be seen with iPhone usage with the blind and visually impaired, Mobile technology has much promise for people with disabilities. However as with Web accessibility, the realization of accessible mobile experiences depends on product teams doing their part during site and app design and development. I hope this overview got you thinking about some things your organization can do when creating your next mobile web site or app. As mobile accessibility standards become clearer in 2013, I will keep you informed in “The Wave”.

Scott Rains—The Rolling Rains Report

Glide-Path

Improving Travel with Reliable Airline Assistance Requests

By [Scott Rains](#) on January 10, 2013 3:13 PM

Glide-Path is a free-to-the-passenger web-based system that enables the passenger to enter more information about their specific needs, which can be accessed by airlines, airports and assistance providers to improve the quality of the service they deliver.

Passengers requesting assistance often experience frustration due to the actual process for making requests,

- separate requests for each journey/airline
- different information required on different forms
- details not passed to the airport staff
- sometimes it's a telephone call, sometimes a fax, sometimes online forms

And finally, just when think you've told the airline everything possible, you get to the airport and they have no idea of exactly what assistance you need.

With **Glide-Path** it's 3 simple steps:

1. You tell us just once about you and your assistance needs
2. Tell us about your journeys (this will be automatic from your booking in later versions)
3. You sit back while we ensure your details and needs are communicated to both the airline and the assistance team at the airport.

Occasionally, if medical clearance is needed, we will ask for you to supply additional information from you doctor.

Glide-Path offers facilities to register details of Assistance Dogs, people who will escort you on your journeys and the give you space to register needs not normally covered by Airline

The Travel Spot - Continued

Scott Rains—The Rolling Rains Report

forms.

We can't guarantee that the airline and airport can meet all your needs, but we can guarantee that they have had the opportunity to know about them.

"We didn't know you were coming" won't cut it anymore.

At **Glide-Path** we have many years of experience in aviation and have been looking at the problems facing elderly and disabled air travelers, particularly addressing the problems miscommunication causes. For airlines, airport and service providers this improved communication and access to detailed information, will facilitate a more effective and efficient service.

This service will go live in early 2013. In advance of this launch our test site <http://www.glide-path-test.co.uk/> can be accessed to create test accounts, view our easy to use input screens and enter data. We would appreciate any feedback info@glide-path.co.uk

Breaking Physical Barriers:

Ingrid M. Kanics, OTR/L, Manager of Physical Accessibility, Springboard Consulting, LLC

Expanding the Concept of the Triple Bottom Line

The phrase “Triple Bottom Line” is one that most in the business world are very familiar with since it was coined by John Elkington in 1997. Even those of us without a business background have heard the phrase as assorted permutations of it have developed in other fields.

One such permutation is the Smart Housing Initiative that was developed by the Department of Housing and Public Works of Queensland, Australia. The goal of the initiative was to provide guidelines to build more socially, environmentally and economically sustainable housing in Queensland.

The reality is that this model is one that can and should be used by any businesses that want to be on the cutting edge of creating environments where all employees can thrive.

For those familiar with the “Triple Bottom Line” this version definitely has some familiar components. The Economic and Environmental elements in the Queensland model basically the same. The environment designed should be cost-efficient over time (economic sustainability) and should be efficient in how it uses resources in materials and operations (environmental sustainability).

Where the model differs is in the social sustainable component that is a triangle of its own. The overall concept of fair and beneficial business practices toward people in which a corporation conducts their business is still the end result but the focus is more specifically on how the environment is designed to help this happen.

Here social sustainability is developed by three components; creating environments that are safe, environments that are secure and incorporate universal design so that the environment is flexible and comfortable for people with varying abilities. Here again the ideas of designing and operating a work place that meets safety standards and is a secure play for employees to work is not new to corporations. The incorporation of universal design principles to

Breaking Physical Barriers - Continued

Ingrid M. Kanics, OTR/L, Manager of Physical Accessibility, Springboard Consulting, LLC

create a flexible and welcoming work environment for all may be a newer concept for most businesses. Many businesses today have embraced not just the physical requirements of the ADA but also the spirit of the ADA working with their staff of varying abilities to create a great work environment for all. But for most of the world the ADA does not apply. So how do they create a work environment that enables all to contribute to the mission of the organization? I believe that the businesses that partner universal design principles with their operational design needs are those that are pushing the limits of what true inclusive design can be in our world. These principles are as follows:

1. Equitable Use
2. Flexibility in Use
3. Simple and Intuitive
4. Perceptible Information
5. Tolerance for Error
6. Low Physical Effort
7. Size and Space for Approach and Use

Over the next few months I would like to share these 7 principles of universal design with you. I would like to explain what they mean from my perspective as a designer, as an occupational therapist and as an individual with a disability. I will provide examples of how they can be incorporated in the corporate environment so that all benefit from the design. I also want to show the benefit of these being incorporated into your design and thought processes as opposed to being something that has to be added on top of those processes. The overall goal is to expand your “triple bottom line” to include a “triple bottom line” work environment that enables each member of your organization to thrive!

Guest Writers - Kathi Stearman and Kelly Stearman: *Employment Compliance Department, Brown-Forman*

“Day In The Life”

Brown-Forman is working very hard to increase its organizational knowledge in the disability arena. As an organization we feel we do a good job spotlighting the various areas of diversity but the topic of disability often goes without mention. To begin highlighting disability issues, we invited Nadine to come to our Celebration of Diversity week in October of 2012 and introduce this very important topic to our workforce. To maintain momentum on the disability topic, we felt that doing the “Day in the Life” activity would be a great extension of our Celebration of Diversity, and on Tuesday, December 4th, 2012 Brown-Forman embarked on its first ever “Day in the Life” exercise at our corporate campus in Louisville, Kentucky. This date was not chosen arbitrarily, as it was carefully planned to coincide with the “International Day of Persons with Disability”, which was nationally celebrated just the day before on December 3, 2012.

As I mentioned, this was our first experience with planning such an event and we knew we should try to keep it simple for our first try. Nadine was very helpful in walking us through how the day should be organized, what disabilities could be easily simulated and how to simulate them, and assisted us in developing pre-simulation and post-simulation questions to ask our participants.

Several weeks beforehand we put a call out to our employees asking for volunteers to participate in the day, asking them if they had ever wondered what it would be

like trying to do their job if they had problems seeing, hearing, or walking. Could they maneuver a wheelchair around their workspace or around our vast campus? Well, we were giving them a chance to find out! We had 8 participants who volunteered: a very manageable number for our first go at this. We learned that some of the participants have friends or family members struggling with some of the disabilities that were being simulated and volunteered for this reason. One employee who volunteered for the activity is a mother whose

Guest Writers - Continued

Kathi Stearman and Kelly Stearman, Employment Compliance Department, Brown-Foreman

son has a progressive nerve disease. The disease affects his motor skills and he is progressively approaching his need to use a wheelchair. Another employee shared with us that he is diabetic and the one thing he fears the most is eventually going blind as a result of his diabetes. For these individuals, the day was personal. On the other hand, some volunteered for organizational reasons. One individual from IT said he wanted to participate to gain insights on accommodations from an IT innovation stand point. Another individual said he was interested in participating because he's a big guy that people notice and people know who he is so he felt he was a good person to help create awareness for the exercise!

For this half-day exercise, we had two employees that simulated hearing loss, 2 simulated vision loss, 2 simulated loss of limb and 2 were using a wheelchair for the day. Aside from just going about their normal workday, we had a short list of items we wanted each employee to experience, including taking a tour of our campus, using the restroom, and eating a meal in our café. These would be tests for us an organization and areas in which we could gain some valuable insight. For the rest of our workforce that was not participating in the day, we encouraged them that if they saw one of their colleagues engaging in "A Day in the Life" program (and they would know this because they'd be the ones in the green t-shirts), to feel free to ask them how it was going!

We began the day in our conference center, which is located on the far side of our campus, and assembled everyone into their disability role. We then proceeded on a tour of our campus, which was surely the most challenging tour ever given by our campus tour guide. The participants were then instructed to go about their normal workday, as best they could, many making notes of issues and challenges they faced. We then met for lunch as a group in our corporate café, had lunch, participated in a group discussion and concluded with post-simulation, video-taped interviews of each individual participant.

The day was a real eye-opening experience for everyone; both the participants and those of us that helped administer the exercise. You gain an appreciation for what thousands of people are dealing with in their daily lives. From the tour, we realized just how difficult it can be to maneuver our campus in a wheelchair. Just the slightest crack in the pavement or incline can become an obstacle. Over a noisy lunch, you pick up really quickly on just how isolating it can be when you can't hear what's going on in the conversation. You see that once gregarious person just withdraw from the conversation altogether. We heard stories of how you begin to rely on your sense of sound when you can't see to get on or off an elevator. One employee said she started listening to the "dings" to orient her as to what floor she was on! From an organizational standpoint, we were able to gain valuable insights that we will incorporate into how we accommodate our employees, how we can better give tours of our campus, how we can assist guests in our Café, and the accommodations we might need for our visitors. All in all it was a very enlightening experience, and one we hope to repeat next year with even more employees participating!

The Disability ERG Summit - U.S. 2013
